

Incident Notification

Incident Date: April 22, 2025

Title: **McClellan Lake Operation – Dangerous Occurrence,
Liquid Ammonia Release into Berm**

Description: A tote containing aqueous ammonia solution began to leak within a containment berm for ammonia storage. Approximately 0.8 m³ of liquid escaped the tote. The solution created ammonia vapour off-gassing in the area, triggering elevated readings on the sensors.

Resolution: The source of the leak (hose) was identified and removed from the tote. The berm area was restricted and a safe work plan developed to remove the liquid and melt water in the area using a vacuum truck. No effects on the environment, health or safety. Regulatory authorities have been notified.
